AI FOR GOOD · HACKATHON 2 RESIT · SDG 3

CareCircle

A shared care log for families who care for an older relative at home

Haki Abdulovski (23177314) · Yassir Balah (26095270) · built in n8n with Telegram, Gemini and Google Sheets

Care at home runs on a busy group chat

5.5 million

people in the Netherlands give informal care (2024)

600,000

of them felt seriously burdened, up from 400,000 in 2014

300,000

people live with dementia

800,000

relatives and friends care for them

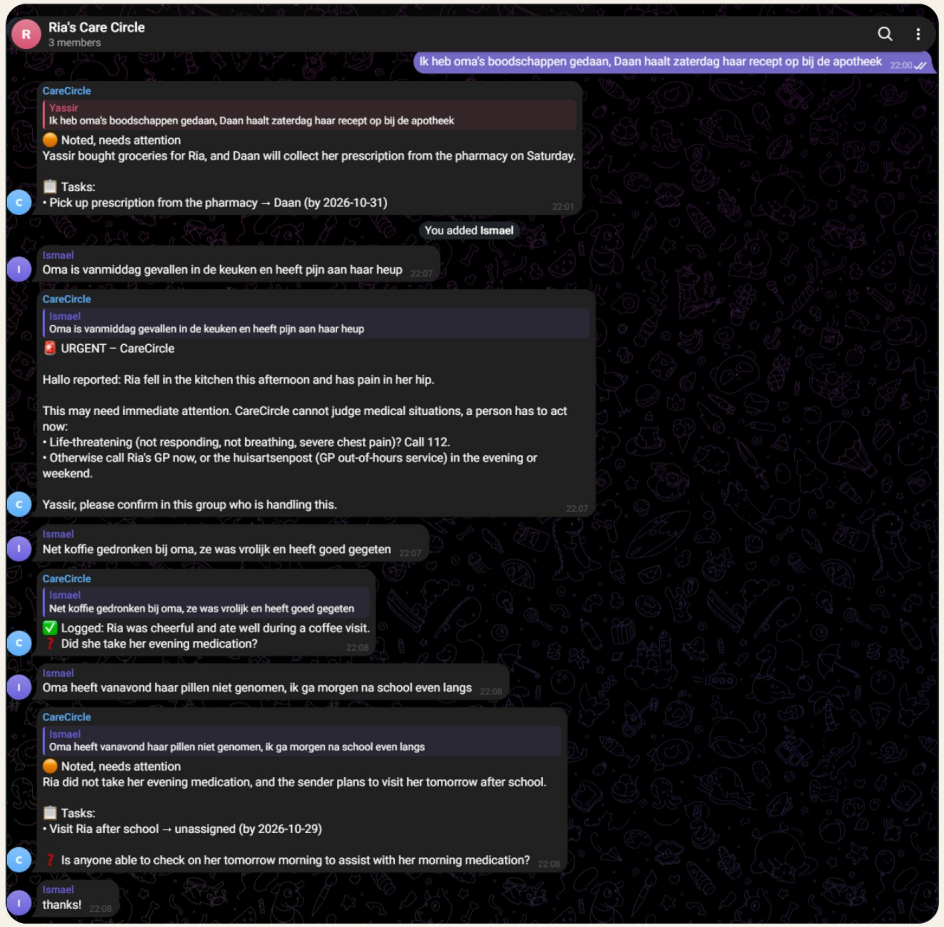

Updates get lost between relatives: a missed dose, a fall that “seemed fine”, a task nobody picked up.

Sources: SCP via NOS (May 2026); Alzheimer Nederland and Nivel, Dementiemonitor

What changed since the first attempt

Feedback	First attempt: AirCalm	Resit: CareCircle
K1 · AI tool	AI only rewrote air-quality numbers into sentences; a template could replace it	AI reads free-text messages, decides urgency, extracts tasks with owners and finds weekly patterns. Without it, nothing works.
K3 · Scope	One public data source; the same as googling “air quality today”	The family’s own private observations, a memory over weeks, and real actions: log, tasks, alerts, report
Flow	One schedule, one message	Two triggers, 23 nodes, three urgency routes and a code safety net

What the family sees

Urgent

A fixed alert, never AI-written: call 112 or the GP, and the coordinator confirms who acts.

Attention

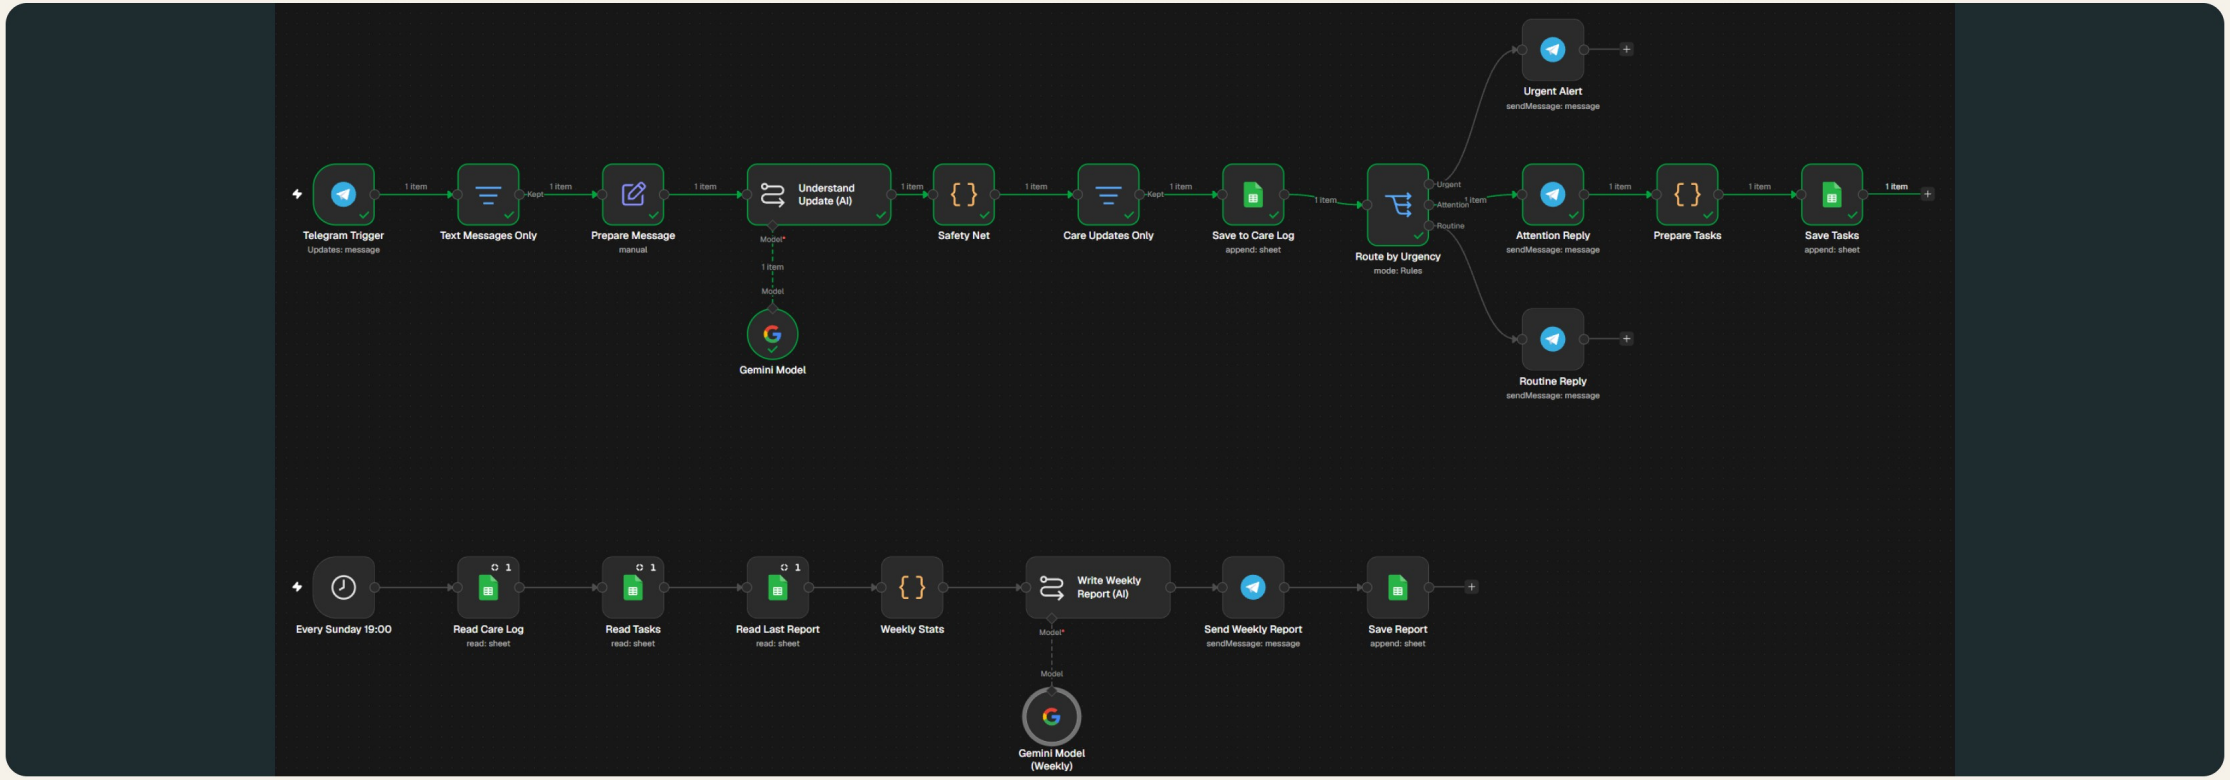

Tasks with an owner and a date, plus a question when information is missing.

Routine

A short confirmation that the update is in the care log.

Not a care update, like “thanks!”: ignored, nothing is logged.

Two flows, 23 nodes

Top · every message

Telegram → AI understands → safety net → care log → route by urgency → reply, tasks

Bottom · Sunday 19:00

Read log, tasks and last report → code counts → AI writes report → send and save

WHY AI IS ESSENTIAL

AI interprets. Code guards. People decide.

AI interprets

Reads free text in Dutch or English: categories, urgency, summary, tasks with owner and date. Writes the weekly report.

Code guards

Red-flag words like “gevallen” always escalate to urgent. Unreadable AI output goes to a human.

People decide

Every urgent alert, medication question and GP visit stays with the family and professionals.

“Oma heeft vanavond haar pillen niet genomen, ik ga morgen na school even langs”

→ medication · attention · task: Visit Ria after school → Yassir, due 29 Oct

It runs: the care log from a live test

Message in the group	Urgency	What CareCircle logged
Oma heeft vanavond haar pillen niet genomen, ik ga morgen na school even langs	attention	Ria did not take her evening medication tonight; Yassir visits tomorrow. Task saved for Yassir, due 29 Oct.
Net koffie gedronken bij oma, ze was vrolijk en heeft goed gegeten	routine	Yassir visited Ria for coffee; she was cheerful and ate well.
Oma is vanmiddag gevallen in de keuken en heeft pijn aan haar heup	urgent	Ria fell in the kitchen and has hip pain. Urgent alert sent to the group.
Ik heb oma's boodschappen gedaan, Daan haalt zaterdag haar recept op bij de apotheek	attention	Task: pick up prescription from the pharmacy → Daan, due Saturday 31 Oct
thanks!	ignored	Not a care update, nothing logged

The weekly report sees the whole week

Honest about patterns

The first report said there was too little data for patterns, instead of inventing them. Patterns need at least two log entries.

Care load

It noticed that Yassir sent 100% of the updates and held the only open task, and suggested Mo and Daan take on visits.

Questions for the GP

Neutral questions to bring along, such as which check is advised for the hip pain after the fall.

Memory

Each report is saved and read again next week, so changes over time become visible.

First automatic run: Sunday 1 November, 19:00. Every report ends with “not a medical assessment”.

SDG 3 · GOOD HEALTH AND WELL-BEING

Better care for the relative, less strain on the family

Target 3.4

Mental health and well-being of caregivers: tasks are shared and an uneven care load becomes visible.

Target 3.8

Access to good care: changes are noticed earlier, and the family brings structured observations to the GP.

For whom: families and friends who share the care of an older relative living at home.

Where automation stops

When it is wrong

A missed emergency is the worst error. The red-flag list helps but cannot catch every wording. The original message is always kept beside the summary.

When it is late or down

A chat is not an emergency call: call 112 first. Every care update gets a reply, so silence shows the system is down.

Privacy and dignity

Health data of someone who may not consent. The demo is fictional; the free Gemini tier may use inputs. Ask Ria herself first.

A human takes over

At every urgent alert, every medication or symptom question, and at the GP: AI prepares, people ask and decide.

WOULD I TRUST IT?

For coordination, yes. For safety, only as a backup.

CareCircle never decides that something is fine. It keeps the family informed, shares the work, and hands every medical decision to people.

Thank you · Questions? · Live demo: a message in Ria’s Care Circle
